

Project Design Phase

Solution Architecture

Project Name: ServiceNow-Based Employee Laptop Request Application

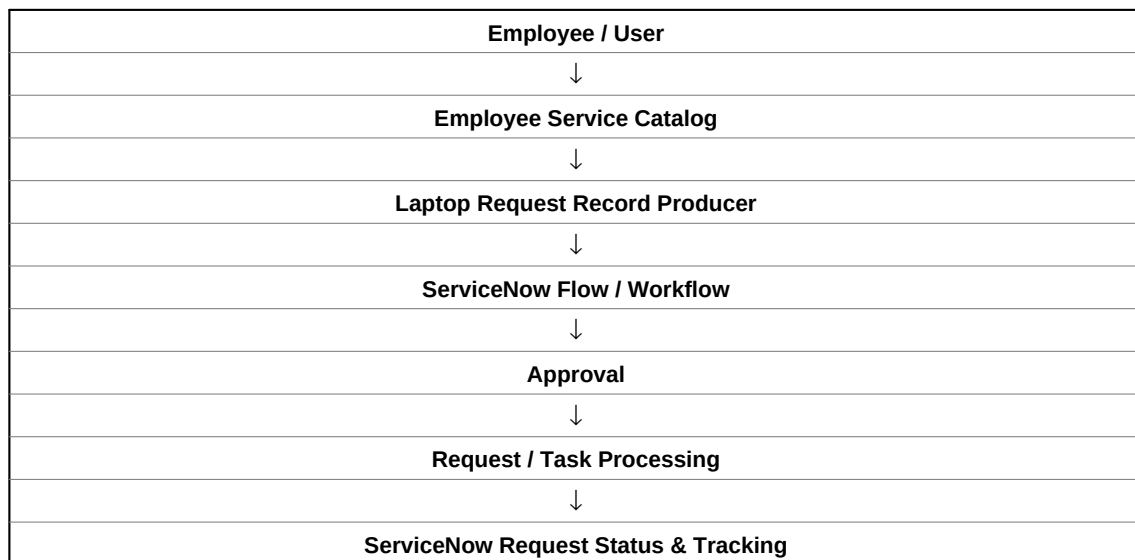

Maximum Marks: 4 Marks

Solution architecture is used to bridge the business problem and the technology solution. For this project, the architecture defines the structure, behavior, components, request flow, and requirements of the ServiceNow-based employee laptop request application.

Goals of the Solution Architecture:

- Provide a self-service method for employees to submit laptop requests.
- Define the components involved in creating and processing a laptop request.
- Describe the request flow from submission through approval and processing.
- Provide a structured and traceable request-management process in ServiceNow.

Solution Architecture Diagram:

Architecture and Data Flow:

The employee starts the process by accessing the Employee Service Catalog and submitting a laptop request. The Laptop Request Record Producer captures the required request details and creates the request in ServiceNow. The configured ServiceNow flow manages the request process and sends it for the required approval. After approval, the request proceeds to the appropriate request or task-processing activities. The ServiceNow platform maintains the request information and supports status tracking throughout the process.
